

## Form Processing

In this assignment you need to create a form to allow the user to enter their name, email, phone, and address information. That information will be sent to a PHP script that will process and display that information.

Your assignment should have two pages. The first page is straight html (***user\_input.html***) that has a form with the appropriate form elements to collect the user input. The form should then be submitted using the ***POST method*** to a PHP script (***display\_user\_info.php***) that will process the user input. The PHP script should display the user input with a link to return back to the user\_input.html page. Both the form and the results are in a table. Use the attached ***styles.css*** to style your form and results. Do not put the styles directly into the html and php pages. Use a link to the external styles.css file from both the html and PHP pages.

Include ***comments*** in both the html and PHP files. Comments should include but not limited to your name, purpose of the file, and assignment completion date.

Zip all three files (html, PHP, and css) and submit it through the assignment drop box.
